Guideline for European technical approval of "Metal anchors for use in concrete", ETAG 001 Part 3:  
"Undercut anchors", April 2013,  
used as European Assessment Document (EAD)  
according to Article 66 Paragraph 3 of Regulation (EU)  
No 305/2011.

**European Technical Assessment**

**ETA-98/0004**

English translation prepared by DIBt

**Page 2 of 30 | 22 December 2015**

The European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction shall be identified as such.

This European Technical Assessment may be withdrawn by the issuing Technical Assessment Body, in particular pursuant to information by the Commission in accordance with Article 25(3) of Regulation (EU) No 305/2011.

**Specific Part****1 Technical description of the product**

The fischer-Zykon-Anchor FZA, FZA-D and FZA-I is an anchor made of galvanised or stainless or high corrosion resistant steel which is placed in an undercut hole and anchored by mechanical interlock with displacement-controlled installation.

The bolt projection anchor FZA and the through bolt anchor FZA-D consists of a conical bolt with external thread, an expansion sleeve and a hexagon nut with washer.

The internal threaded anchor FZA-I consists of a conical bolt with internal thread and an expansion sleeve. The anchor is anchored by impact acting on the expansion sleeve over the cone bolts in the undercuts of the borehole.

The product description is given in Annex A.

**2 Specification of the intended use in accordance with the applicable European Assessment Document**

The performances given in Section 3 are only valid if the anchor is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the anchor of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

**3 Performance of the product and references to the methods used for its assessment****3.1 Mechanical resistance and stability (BWR 1)**

Essential characteristic	Performance
Characteristic resistance for static and quasi static action to tension	See Annex C1 – C5
Characteristic resistance for static and quasi static action to shear load	See Annex C6 – C10
Characteristic resistance for seismic performance category C1	See Annex C11 – C12
Displacements	See Annex C13 - C15

**3.2 Safety in case of fire (BWR 2)**

Essential characteristic	Performance
Reaction to fire	Anchorage satisfies requirements for Class A1
Resistance to fire	No performance determined

**3.4 Safety in use (BWR 4)**

The essential characteristics regarding Safety in use are included under the Basic Works Requirement Mechanical resistance and stability.

**4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base**

In accordance with guideline for European technical approval ETAG 001, April 2013 used as European Assessment Document (EAD) according to Article 66 Paragraph 3 of Regulation (EU) No 305/2011 the applicable European legal act is: (1996/582/EC, OJ)

The system to be applied is: 1

**5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable European Assessment Document**

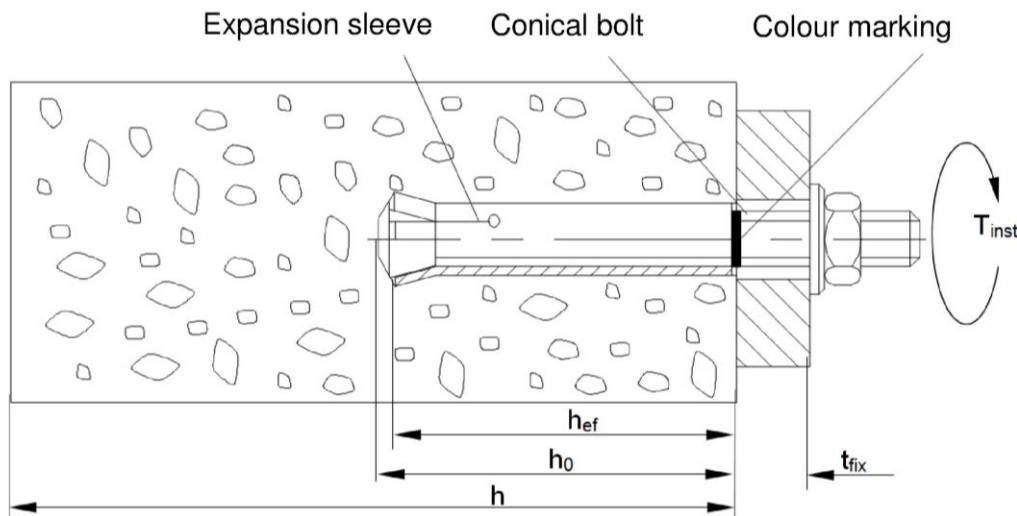

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited at Deutsches Institut für Bautechnik.

Issued in Berlin on 22 December 2015 by Deutsches Institut für Bautechnik

<sup>4)</sup> Related screws or threaded rods: property class  $\geq 70$  according to EN ISO 3506-1; ductility  $A_5 > 8\%$ ; High corrosion resistant steel 1.4529, 1.4565 according EN 10088.

fischer-Zykon-Anchor FZA, FZA-D , FZA-I

**Product description**  
Materials

**Annex A7**

## Specifications of intended use

### Anchorage subject to:

- Static and quasi-static loads
- Seismic Performance Category C1 sizes FZA14x40, FZA14x60, FZA18x80, FZA22x100, FZA 22x125 and FZA14x80D/20, FZA14x100D/40, FZA18x100D/20, FZA18x130D/50, FZA22x125D/25

### Base materials:

- Reinforced and unreinforced normal weight concrete according to EN 206-1:2013
- Strength classes C20/25 to C50/60 according to EN 206-1:2013
- Cracked and non-cracked concrete

### Use conditions (Environmental conditions):

- Structures subject to dry internal conditions  
(Zinc plated steel, hot-dip galvanized steel, stainless steel, high corrosion-resistant steel)
- Structures subject to external atmospheric exposure (including industrial and marine environment) and to permanently damp internal condition, if no particular aggressive conditions exist.  
(stainless steel, high corrosion-resistant steel)
- Structures subject to external atmospheric exposure and permanently damp internal condition, if other particular aggressive conditions exist  
(high corrosion-resistant steel)

Note: Particular aggressive conditions are e.g. permanent, alternating immersion in seawater or the splash zone of seawater, chloride atmosphere of indoor swimming pools or atmosphere with extreme chemical pollution (e.g. in desulphurization plants or road tunnels where de-icing materials are used).

### Design:

- Anchorages are to be designed under the responsibility of an engineer experienced in anchorages and concrete work.
- Verifiable calculation notes and drawings are to be prepared taking account of the loads to be anchored. The position of the anchor is indicated on the design drawings (e.g. position of the anchor relative to reinforcement or to supports, etc.).
- Anchorages under static or quasi-static actions are to be designed in accordance with (please choose the relevant design method):
  - ETAG 001, Annex C, design method A, Edition August 2010 or
  - CEN/TS 1992-4:2009, design method A
- Anchorages under seismic actions (cracked concrete) are to be designed in accordance with:
  - EOTA Technical Report TR 045, Edition February 2013
  - Anchorages shall be positioned outside of critical regions (e.g. plastic hinges) of the concrete structure.
  - Fastenings in stand-off installation or with a grout layer under seismic action are not allowed.

### Installation:

- Anchor installation carried out by appropriately qualified personnel and under the supervision of the person responsible for technical matters of the site.
- Anchor installation such that the effective anchorage depth is complied with. This requirement is ensured when the expansion sleeve in the case of bolt anchor and anchor with internal thread is placed about 1mm under the concrete surface and in case of the through bolt anchor is placed about 1mm under the surface of the fixture.

fischer Zykron Anchor FZA, FZA-I , FZA-D

**Intended Use**

Installation parameters - Minimum thickness of concrete member, minimum spacings and minimum edge distances

**Annex B3**

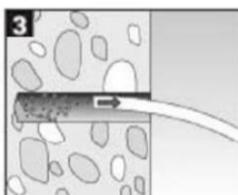

## Installation instructions for FZA, FZA-D, FZA-I Pre-positioned anchorage

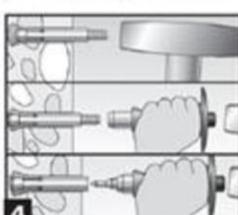

Create a drill hole at right angles to the surface of the anchor base with a hammer drill, using the corresponding ZYKON universal drill bit FZUB. The required drill depth is reached once the FZUB depth stop meets the concrete.

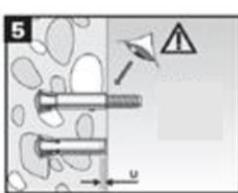

Once the FZUB depth stop meets the concrete, create the drill hole undercut by making circular swiveling movements with the hammer drill while the hammer mechanism is engaged. Press the hammer drill firmly against the anchor base: 1-2 swiveling movements are sufficient for  $\varnothing 14$  mm, with 3-5 movements for  $\varnothing 18$  mm and  $\varnothing 22$  mm

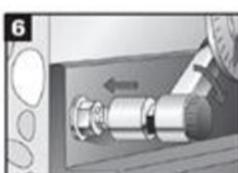

Clean drill hole.

Insert the anchor into the drill hole and then drive the expansion sleeve in with hammer-set device FZE Plus, using a manual hammer. The setting depth marking (knurl) is approx. 1mm behind the surface of the concrete or the non-load-bearing layer (see Fig. 5).

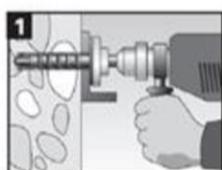

The anchor is correctly expanded if the colour marking on the thread of the tapered bolt is visible or the gap  $u$  is fulfilled.

Mount installation object (e.g. anchor plate), washer and nut, screw (for FZA-I) or threaded rod with washer and nut (for FZA-D) and apply installation torque with torque spanner.

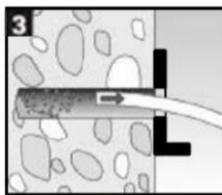

## Push-through installation

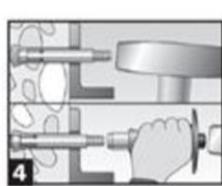

Create a drill hole through the installation object at right angles to the surface of the anchor base with a hammer drill, using the corresponding ZYKON universal drill bit FZUB. The required drill depth is reached once the FZUB depth stop meets the fixture.

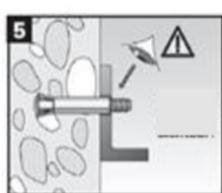

Once the FZUB depth stop meets the fixture, create the drill hole undercut by making circular swiveling movements with the hammer drill while the hammer mechanism is engaged. Press the hammer drill firmly against the anchor base: 1-2 swiveling movements are sufficient for  $\varnothing 14$  mm, with 3-5 movements for  $\varnothing 18$  mm and  $\varnothing 22$  mm

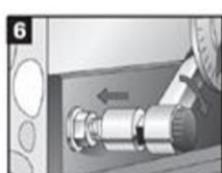

Clean drill hole.

Insert the anchor into the drill hole and then drive the expansion sleeve in with hammer-set device FZE Plus, using a manual hammer. The setting depth marking (knurl) is approx. 1mm behind the surface of the concrete or the non-load-bearing layer (see Fig. 5).

The anchor is correctly expanded if the colour marking on the thread of the tapered bolt is visible.

Mount installation object (e.g. anchor plate), washer and nut and apply installation torque with torque spanner.

**Table C1:** Characteristic values of **tension** resistance under static and quasi-static action **for bolt projecting anchor FZA** (Design method A, according to **ETAG 001, Annex C** or **CEN/TS 1992-4**)
