Approval body for construction products and types of construction

Bautechnisches Prüfamt

An institution established by the Federal and Laender Governments

Designated according to Article 29 of Regulation (EU) No 305/2011 and member of EOTA (European Organisation for Technical Assessment)

European Technical Assessment

ETA-11/0006 of 18 July 2018

English translation prepared by DIBt - Original version in German language

General Part

Technical Assessment Body issuing the European Technical Assessment:	Deutsches Institut für Bautechnik
Trade name of the construction product	Hilti anchor channels - HAC with channel bolts - HBC
Product family to which the construction product belongs	Cast-in anchor channel
Manufacturer	Hilti AG Feldkircherstraße 100 9494 Schaan FÜRSTENTUM LIECHTENSTEIN
Manufacturing plant	Hilti Werke
This European Technical Assessment contains	28 pages including 3 annexes which form an integral part of this assessment
This European Technical Assessment is issued in accordance with Regulation (EU) No 305/2011, on the basis of	EAD 330008-03-0601
This version replaces	ETA-11/0006 issued on 1 February 2016

electronic copy of the eta by dibt: eta-11/0006

The European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction shall be identified as such.

This European Technical Assessment may be withdrawn by the issuing Technical Assessment Body, in particular pursuant to information by the Commission in accordance with Article 25(3) of Regulation (EU) No 305/2011.

electronic copy of the eta by dibt: eta-11/0006

Specific Part

1 Technical description of the product

The Hilti anchor channel (HAC) with channel bolts (HBC) is a system consisting of V-shaped channel profile of carbon steel and at least two metal anchors non-detachably fixed to the channel back and channel bolts.

The anchor channel is embedded surface-flush in the concrete. Hilti channel bolts with appropriate hexagon nuts and washers are fixed to the channel.

The product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European Assessment Document

The performances given in Section 3 are only valid if the anchor channel is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the anchor channel of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance of anchor channel under tension load (static and quasi-static loading)	See Annex C1 to C2
Characteristic resistance of anchor channel under shear load perpendicular to the longitudinal axis of the channel (static and quasi-static loading)	See Annex C3 to C4
Characteristic resistance of anchor channel under shear load in the direction of the longitudinal axis of the channel (static and quasi-static loading)	See Annex C3 to C5
Characteristic resistance of anchor channel under combined tension and shear (static and quasi-static loading)	See Annex C5
Characteristic resistance of channel bolt under tension and shear load (static and quasi-static loading)	See Annex C6 to C7
Displacements (static and quasi-static loading)	See Annex C3 and C5
Characteristic resistances under fatigue cyclic load	See Annex C9 to C10

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1
Characteristic resistance to fire	See Annex C8

electronic copy of the eta by dibt: eta-11/0006

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with EAD No. 330008-03-0601, the applicable European legal act is: [2000/273/EC].

The system to be applied is: 1

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable EAD

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

Issued in Berlin on 18 July 2018 by Deutsches Institut für Bautechnik

Deutsches Institut für Bautechnik DIBt

Specifications of intended use

Anchor channels and channel bolts subject to:

- Static and quasi-static loads in tension and shear perpendicular to the longitudinal axis of the channel for HAC in combination with HBC-C and HBC-C-E as well as static and quasi-static loads in tension, shear perpendicular to the longitudinal axis of the channel and shear in the direction of the longitudinal axis of the channel for HAC in combination with HBC-B, HBC-C-N and HAC-T in combination with HBC-T.
- Fatigue cyclic loads.
- Fire exposure: only for concrete class C20/25 to C50/60.

Base materials:

- Reinforced or unreinforced normal weight concrete according to EN 206-1: 2000.
- Strength classes C12/15 to C90/105 according to EN 206-1: 2000.
- Cracked or uncracked concrete.

Use conditions (Environmental conditions):

- Structures subject to dry internal conditions (e.g. accommodations, bureaus, schools, hospitals, shops, exceptional internal conditions with usual humidity)
  (anchor channels and channel bolts according to Annex A5, Table 5, column 2 and 3).
- Structures subject to internal conditions with usual humidity (e.g. kitchen, bath and laundry in residential buildings, exceptional permanent damp conditions and application under water)
  (anchor channels and channel bolts according to Annex A5, Table 5, column 2c and 3).
- The stainless steel Hilti channel bolts (HBC), washers and nuts may be used in structures subject to external atmospheric conditions (including industrial and marine environment) or exposure in permanently damp internal conditions, if no particular aggressive conditions (e.g. permanent, alternating immersion in seawater or the splash zone of seawater, chloride atmosphere of indoor swimming pools or atmosphere with chemical pollution e.g. desulphurization plants or road tunnels where de-icing materials are used) exist
  (channel bolts according to Annex A5, Table 5, column 3).

Design:

- Anchor channels are designed under the responsibility of an engineer experienced in anchorages and concrete work.
- Verifiable calculation notes and drawings are prepared taking account of the loads to be anchored. The position of the anchor channel and channel bolts are indicated on the design drawings (e.g. position of the anchor channel relative to the reinforcement or to supports).
- For static and quasi-static loading as well as fire exposure the anchor channels are designed in accordance with EOTA TR 047 “Design of Anchor Channels”, March 2018 or FprEN 1992-4: 2016.
- For fatigue loading the anchor channels are designed in accordance with EOTA TR 050 “Calculation Method for the Performance of Anchor Channels under Fatigue Loading”, November 2015.
- The characteristic resistances are calculated with the minimum effective embedment depth.

Hilti anchor channels (HAC) with channel bolts (HBC)	Annex B1
Intended Use Specifications	

electronic copy of the eta by dibt: eta-11/0006

Deutsches Institut für Bautechnik DIBt

Installation:

- The installation of anchor channels is carried out by appropriately qualified personnel under the supervision of the person responsible for the technical matters on site.
- Use of the anchor channels only as supplied by the manufacturer - without any manipulations, repositioning or exchanging of channel components.
- Cutting of anchor channels is allowed only if pieces according to Annex B3, Table 6 are generated including end spacing and minimum channel length and only to be used in dry internal conditions.
- Installation in accordance with the installation instructions given in Annexes B5, B6, B7, B8 and B9.
- The anchor channels are fixed on the formwork, reinforcement or auxiliary construction such that no movement of the channels will occur during the time of laying the reinforcement and of placing and compacting the concrete.
- The concrete under the head of the anchors are properly compacted. The channels are protected from penetration of concrete into the internal space of the channels.
- Washer may be chosen according to Annex A5 and provided separately by the user.
- Orientating the channel bolt (groove according to Annex B6, B7, B8 and B9) rectangular to the channel axis.
- The required installation torques given in Annex B3 and B4 must be applied and must not be exceeded.

Table 28: Reduction factor $\eta_{c,fat}$ with n load cycles without static preload (N_{Ed} = 0) (Design method I according to EOTA TR 050)

Anchor channel		HAC-30	HAC-40	HAC-50	HAC-60	HAC-70
Pullout failure **Concrete cone failure**	n	$\eta_{c,fat}$ [-]				
Reduction factor for $\Delta N_{Rk,p;0;n} = \eta_{c,fat} \cdot N_{Rk,p}$ $\Delta N_{Rk,c;0;n} = \eta_{c,fat} \cdot N_{Rk,c}$ with $N_{Rk,p}$ according to Annex C2 and $N_{Rk,c}$ calculated according to EOTA TR 047, March 2018 or FprEN 1992-4: 2016	$\leq 10^6$	0,600				
	$\leq 3 \cdot 10^6$	0,571				
	$\leq 10^7$	0,542				
	$\leq 3 \cdot 10^7$	0,516				
	$\leq 6 \cdot 10^7$	0,500				
	$> 6 \cdot 10^7$					

Table 29: Characteristic resistances under fatigue tension load with n → ∞ load cycles without static preload (N_{Ed} = 0) (Design method II according to EOTA TR 050)

Anchor channel		HAC-30	HAC-40	HAC-50	HAC-60	HAC-70
Steel failure						
$\Delta N_{Rk,s;0;\infty}$	[kN]	1,6	1,5	2,6	3,5	6,4
Concrete cone and pullout failure						
$\eta_{c,fat}$	[-]	0,5				

For the reduction of the characteristic resistances given in Tables 27 and 28 in the transition zone from the static resistance to the fatigue limit resistance the partial safety factors are calculated as follows:

$$\gamma_{M,fat,n} = \gamma_{M,fat} + (\gamma_M - \gamma_{M,fat}) \cdot (\Delta N_{Rk,n} - \Delta N_{Rk,\infty}) / (N_{Rk} - \Delta N_{Rk,\infty})$$

In absence of other national regulations the following safety factors γ_M and $\gamma_{M,fat}$ are recommended for design method I according to EOTA TR 050:

γ_M according Annex C1

$\gamma_{M,fat}$ = 1,35

In absence of other national regulations the following safety factor $\gamma_{M,fat}$ is recommended for design method II (Table 29) according to EOTA TR 050:

$\gamma_{M,fat}$ = 1,35
