European Technical Assessment

ETA-13/0847

English translation prepared by DIBt

Page 2 of 20 | 27 June 2018

The European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction shall be identified as such.

This European Technical Assessment may be withdrawn by the issuing Technical Assessment Body, in particular pursuant to information by the Commission in accordance with Article 25(3) of Regulation (EU) No 305/2011.

Specific Part**1 Technical description of the product**

The subject of this European Technical Assessment is the post-installed connection, by anchoring or overlap connection joint, of reinforcing bars (rebars) in existing structures made of normal weight concrete, using the "Rebar connection with BTI injection mortar UVT Top" in accordance with the regulations for reinforced concrete construction.

Reinforcing bars made of steel with a diameter ϕ from 8 to 28 mm or the rebar anchor FRA from sizes 12, 16 and 20 according to Annex A and injection mortar UVT Top or UVT Top S are used for rebar connections. The rebar is placed into a drilled hole filled with injection mortar and is anchored via the bond between rebar, injection mortar and concrete.

The product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European assessment Document

The performances given in Section 3 are only valid if the anchor is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the rebar connection of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment**3.1 Mechanical resistance and stability (BWR 1)**

Essential characteristic	Performance
Characteristic resistance under static and quasi-static loading	See Annex C 1

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1
Resistance to fire	No performance assessed

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with European Assessment Document EAD No. 330087-00-0601, the applicable European legal act is: [96/582/EC].

The system(s) to be applied is (are): 1

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable European Assessment Document

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

Issued in Berlin on 27 June 2018 by Deutsches Institut für Bautechnik

Product description

Installed condition and examples of use for rebars

Annex A 1

Installation anchor

Figure A6: Lap to a foundation of a column under bending.

Figure A7: Lap of the anchoring of guardrail posts.
In the anchor plate, the drill holes for the rebar anchors FRA have to be designed as elongated holes with axial direction to the shear force.

Figure A8: Lap of the anchoring of cantilevered building components.
In the anchor plate, the drill holes for the rebar anchors FRA have to be designed as elongated holes with axial direction to the

The required transverse reinforcement acc. to EN 1992-1-1:2004+AC:2010 is not shown in the figures.
The rebar anchor FRA may be only used for axial tensile force. The tensile force must be transferred by lap to the existing reinforcement of the building. The transfer of the shear force has to be ensured by suitable measure, e.g. by means of shear force or anchors with European Technical Approval/Assessment (ETA)

Rebar connection with BTI injection mortar UVT Top

Product description
Properties and materials of rebar anchors FRA

Annex A 5

Specifications of intended use

Anchorage subject to:

- Static and quasi-static loads

Base materials:

- Reinforced or unreinforced normal weight concrete according to EN 206-1:2000
- Strength classes C12/15 to C50/60 according to EN 206-1:2000
- Maximum chloride concrete of 0,40% (CL 0.40) related to the cement content according to EN 206-1:2000
- Non-carbonated concrete

Note: In case of a carbonated surface of the existing concrete structure the carbonated layer shall be removed in the area of the post-installed rebar connection with a diameter of $\phi + 60$ mm prior to the installation of the new rebar

The depth of concrete to be removed shall correspond to at least the minimum concrete cover in accordance with EN 1992-1-1:2004+AC:2010

The foregoing may be neglected if building components are new and not carbonated and if building components are in dry conditions

Temperature Range:

- -40°C to +80°C (max. short term temperature +80°C and max long term temperature +50°C)

Use conditions (Environmental conditions) for rebar anchors FRA:

- Structures subject to dry internal conditions (rebar anchors FRA and FRA C)
- Structures subject to external atmospheric exposure (including industrial and marine environment) and to permanently damp internal condition, if no particular aggressive conditions rebar anchors FRA and FRA C)
- Structures subject to external atmospheric exposure and to permanently damp internal condition, if other particular aggressive conditions exist (rebar anchors FRA C)

Note: Particular aggressive conditions are e.g. permanent, alternating immersion in seawater or the splash zone of seawater, chloride atmosphere of indoor swimming pools or atmosphere with extreme chemical pollution (e.g. in desulphurization plants or road tunnels where de-icing materials are used)

Design:

- Anchorages are designed under the responsibility of an engineer experienced in anchorages and concrete work
- Verifiable calculation notes and drawings are prepared taking account of the forces to be transmitted
- Design according to EN 1992-1-1:2004+AC:2010 and Annex B 2 and Annex B3
- The actual position of the reinforcement in the existing structure shall be determined on the basis of the construction documentation and taken into account when designing

Installation:

- Dry or wet concrete
- It must not be installed in flooded holes
- Overhead installation allowed
- Hole drilling by hammerdrill or compressed air drill mode
- The installation of post-installed rebar respectively rebar anchor FRA shall be done only by suitable trained installer and under Supervision on site; the conditions under which an installer may be considered as suitable trained and the conditions for Supervision on site are up to the Member States in which the installation is done
- Check the position of the existing rebars (if the position of existing rebars is not known, it shall be determined using a rebar detector suitable for this purpose as well as on the basis of the construction documentation and then marked on the building component for the overlap joint)

Rebar connection with BTI injection mortar UVT Top

Intended use Specifications

Annex B 1

Figure B1: General construction rules for post-installed rebars

- Only tension forces in the axis of the rebar may be transmitted
- The transfer of shear forces between new concrete and existing structure shall be designed additionally according to EN 1992-1-1:2004+AC:2010
- The joints for concreting must be roughened to at least such an extent that aggregate protrude

¹) If the clear distance between lapped bars exceeds 4ϕ then the lap length shall be increased by the difference between the clear bar distance and 4ϕ

- c concrete cover of post-installed rebar
 c_1 concrete cover at end-face of existing rebar
 $\min c$ minimum concrete cover according to Table B1 and to EN 1992-1-1:2004+AC:2010, Section 4.4.1.2
 ϕ nominal diameter of the bar
 ℓ_0 lap length, according to EN 1992-1-1:2004+AC:2010, Section 8.7.3
 ℓ_v effective embedment depth, $\geq \ell_0 + c_1$
 d_0 nominal drill bit diameter, see Annex B 5

Rebar connection with BTI injection mortar UVT Top

Intended use
General construction rules for post-installed rebars

Annex B 2

Figure B2: General construction rules for post-installed rebar anchors FRA

- Only tension forces in the axis of the FRA may be transmitted
- The tension force must be transferred via an overlap joint to the reinforcement in the building part.
- The transmission of the shear load shall be ensured by appropriate additional measures, e.g. by shear lugs or by anchors with an European Technical Assessment (ETA).
- In the anchor plate, the holes for the tension anchor shall be executed as elongated holes with the axis in the direction of the shear force.

¹⁾ If the clear distance between lapped bars exceeds 4ϕ then the lap length shall be increased by the difference between the clear bar distance and 4ϕ

c	concrete cover of post-installed FRA
c_1	concrete cover at end-face of existing rebar
$\min c$	minimum concrete cover according to Table B1 and to EN 1992-1-1:2004+AC:2010, Section 4.4.1.2
ϕ	nominal diameter of the bar
ℓ_0	lap length, according to EN 1992-1-1:2004+AC:2010, Section 8.7.3
$\ell_{e,ges}$	overall embedment depth, $\geq \ell_v + \ell_e$
ℓ_e	length of the bonded in threaded part
d_0	nominal drill bit diameter, see Annex B 5
t_{fix}	thickness of the fixture
ℓ_v	effective embedment depth

Annex B 5

Safety regulations

Review the Material Safety Data Sheet (SDS) before use for proper and safe handling!

Wear well-fitting protective goggles and protective gloves when working with mortar UVT Top

Important: Observe the instructions for use provided with each cartridge.

1. Drill hole

Note: Before drilling, remove carbonized concrete; clean contact areas (see Annex B 1)

In case of aborted drill hole the drill hole shall be filled with mortar.

Drill hole to the required embedment depth using a hammer-drill with carbide drill bit set in rotation hammer mode or a compressed air drill.

Drill bit sizes see Table B4.

Measure and control concrete cover c

$$c_{\text{drill}} = c + \phi / 2$$

Drill parallel to surface edge and to existing rebar

Where applicable use drilling aid.

For holes $l_v > 20$ cm use drilling aid.

Three different options can be considered:

- A) drilling aid
- B) Slat or spirit level
- C) Visual check

Rebar connection with BTI injection mortar UVT Top

Intended use

Installation instruction part 1

Annex B 6

2.1 Compressed air cleaning

	Blowing three times from the back of the hole with oil-free compressed air (min. 6 bar) until return air stream is free of noticeable dust.
	Brushing (with power drill) three times with the specified brush size (brush diameter >: borehole diameter) by inserting the round steel brush to the back of the hole in a twisting motion. The brush shall produce natural resistance as it enters the anchor hole. If this is not the case, please use a new brush or a brush with a larger diameter. For appropriate brushes see Table B4.
	Blowing three times from the back of the hole with oil-free compressed air (min. 6 bar) until return air stream is free of noticeable dust.

Rebar connection with BTI injection mortar UVT Top

Intended use
Installation instruction part 2

Annex B 7

3. Preparation of the rebar or rebar anchor FRA and the cartridge

	Before use, make asure that the rebar or the rebar anchor FRA is dry and free of oil or other residue. Mark the embedment depth on the rebar (e.g. with tape) ℓ_v Insert rebar in borehole, to verify hole and setting depth ℓ_v resp. $\ell_{e,ges}$
Injection system preparation	
	No. 1: Twist off the sealing cap
	No. 2: Twist on the static mixer (the spiral in the static mixer must be clearly visible).
	No. 3: Place the cartridge into a suitable dispenser.
	No. 4: Press out approximately 10 cm of mortar until the resin is permanently grey in colour. mortar which is not grey in colour will not cure and must be disposed of.

4. Inject mortar into borehole

4.1 borehole depth ≤ 250 mm:

	Inject the mortar from the back of the hole towards the front and slowly withdraw the mixing nozzle step by step after each trigger pull. Fill approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length.
	After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle.

Rebar connection with BTI injection mortar UVT Top

Intended use
Installation instruction part 3

Annex B 8

4.2 borehole depth > 250 mm:

	Assemble mixing nozzle, extension tube and injection adapter (see Table B 4)
 Mortar level mark	Mark the required mortar level ℓ_m and embedment depth ℓ_v resp. $\ell_{e,ges}$ with tape or marker on the injection extension tube. a) Estimation: $\ell_m = \frac{1}{3} * \ell_v \text{ resp. } \ell_m = \frac{1}{3} * \ell_{e,ges}$ b) Precise formula for optimum mortar volume: $\ell_m = \ell_v \text{ resp. } \ell_{e,ges} \left(1,2 * \frac{d_s^2}{d_0^2} - 0,2 \right) [\text{mm}]$
 Mortar level mark	Insert injection adapter to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the injection adapter towards the front of the hole. Fill holes approximately 2/3 full, or as required to ensure that the annular gap between the rebar and the concrete is completely filled with adhesive over the embedment length. When using an injection adapter continue injection until the mortar level mark ℓ_m becomes visible. Maximum embedment depth see Table B 2
	After injecting, depressurize the dispenser by pressing the release trigger. This will prevent further mortar discharge from the mixing nozzle.

Rebar connection with BTI injection mortar UVT Top

Intended use
Installation instruction part 4

Annex B 9

4.3 Insert rebar or rebar anchor FRA

	For each installation insert the rebar / rebar anchor FRA slowly twisted into the borehole until the embedment mark is at the concrete surface level.
	For overhead installation support rebar / rebar anchor FRA and secure it from falling till mortar started to harden, e.g. using wedges.
	After installing the rebar / rebar anchor FRA the annular gap must be completely filled with mortar. Proper installation • Desired anchoring embedment is reached ℓ_v: embedment mark at concrete surface. • Excess mortar flows out of the borehole after the rebar has been fully inserted until the embedment mark.
	Observe the working time "t_{work}" (see Table B3), which varies according to temperature of base material. Minor adjustments to the rebar / rebar anchor FRA position may be performed during the working time Full load may be applied only after the curing time "t_{cure}" has elapsed (see Table B 3)

Rebar connection with BTI injection mortar UVT Top

Intended use
Installation instruction part 5

Annex B 10

Minimum anchorage length and minimum lap length

The minimum anchorage length $\ell_{b,min}$ and the minimum lap length $\ell_{o,min}$ according to EN 1992-1-1:2004+AC:2010 ($\ell_{b,min}$ acc. to Eq. 8.6 and Eq. 8.7 and $\ell_{o,min}$ acc. to Eq. 8.11) shall be multiply by an amplification factor α_{lb} according to Table C1.
