### Specific Part

#### 1 Technical description of the product

The PSB double headed studs with ribbed shafts are made of weldable ribbed reinforcement bars with nominal characteristic yield strength of 500 MPa. The mechanical properties of the steel used meet the requirement according to EN 1992-1-1, Annex C.

They have a head at both ends with a diameter of three times the shaft diameter.

The diameters of the shafts are 10, 12, 14, 16, 20 and 25 mm.

The studs are assembled to form reinforcement elements comprising at least two studs (see Annex A1). The studs are tack welded or clamped at one end to a non-structural steel rail or steel bars (reinforcing bars or round bars) for securing the position of the double headed studs when pouring the concrete. For use in semi-prefabricated slabs only, steel rails in connection with special plastic connectors (clip-on plastic connectors) are used to secure the placement during casting. All studs of one of those reinforcement element shall have the same diameter.

The bars used to secure the stud's position during casting (assembly profile) are made of weldable reinforcing steel or structural steel (smooth steel bars)  $d_s = 6$  mm to  $d_s = 10$  mm and the rails are made of structural steel with a thickness of t = 4 mm. The material for the structural steel (bars or rails) shall be No. 1.0037, 10038 or 1.0045 acc. to EN 10025-2 or non-corrosive steel No. 1.4401, 1.4404, 1.4439, 1.4571 acc. to EN 10088-5. The material of the clip-on plastic connectors for use in semi-prefabricated slabs is specified within the technical documentation deposited with Deutsches Institut für Bautechnik.

The detailed product description is given in Annex A.

# 2 Specification of the intended use in accordance with the applicable European Assessment Document

The performances given in Section 3 are only valid if the Product is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the Product of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

#### 3 Performance of the product and references to the methods used for its assessment

### 3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Increasing factor for punching shear resistance	$k_{pu,sl} = 1,96$ $k_{pu,fo} = 1,62$
characteristic fatigue strength for N = 2·10 <sup>6</sup> load cycles	$\Delta \sigma_{\rm Rsk, n=2\cdot 10^6} = 70 \text{ MPa}$

# European Technical Assessment ETA-13/0151

Page 4 of 18 | 14 November 2019

### 3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	class A1

# 4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with EAD No. 160003-00-0301 the applicable European legal act is: [97/597/EC(EU)].

The system(s) to be applied is (are): [1+]

In addition, with regard to reaction to fire for products covered by this EAD the applicable European legal act is: [2001/596/EC(EU)]

The system to be applied is: [4]

# 5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable EAD

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

#### Specification of intended use

The reinforcement elements with double headed studs are intended to be used for the increase of the punching shear resistance of flat slab or footing and ground slabs under static, quasi-static and fatigue loading. The reinforcement elements with double headed studs are located adjacent to columns or high concentrated loads. The design of the punching shear resistance of flat slabs or footings and ground slabs is done in accordance with EOTA TR 060.

The intended use covers the following specifications:

- flat slabs or footings and ground slabs made of reinforced normal weight concrete of strength class C20/25 to C50/60 according to EN 206-1:2013
- flat slabs or footings and ground slabs with a minimum height of h = 180 mm
- flat slabs or footings and ground slabs with a maximum effective depth of d = 300 mm (only for double headed studs with smooth shafts)
- reinforcement elements with double headed studs of the same diameter and type (ripped or smooth) in the punching area around a column or high concentrated load
- reinforcing steel for the studs acc. to EN1992-1-1 may be used with f<sub>yk</sub> ≥ 500 N/mm<sup>2</sup>, in design only f<sub>yk</sub> = 500 N/mm<sup>2</sup> is allowed
- reinforcement elements with double headed studs installed in an upright (rail at the bottom of the slab) or hanging position
- reinforcement elements with double headed studs positioned such that the double headed studs are perpendicular to the surface of the slab or footing
- reinforcement elements with double headed studs directed radially towards the column or high concentrated load and distributed evenly in the critical punching area
- reinforcement elements with double headed studs positioned such that the upper heads of the studs reach at least to the outside of the uppermost layer of the flexural reinforcement
- reinforcement elements with double headed studs positioned such that the lower heads of the studs reach at least to the outside of the lowest layer of the flexural reinforcement
- reinforcement elements with double headed studs positioned such that the concrete cover complies with the provisions according to EN 1992-1-1
- reinforcement elements with double headed studs positioned such that the minimum and maximum distances between the double headed studs on an element and between the elements as arranged around a column or area of high concentrated load complies with the provisions according to Annex B3 to B8
- The provisions are kept on site with an accuracy of 0,1 h (h height of the slab)

PEIKKO PSB Punching Reinforcement	
Intended use Specifications	Annex B1

777343 19 8 03 01-76/19

English translation prepared by DIBt

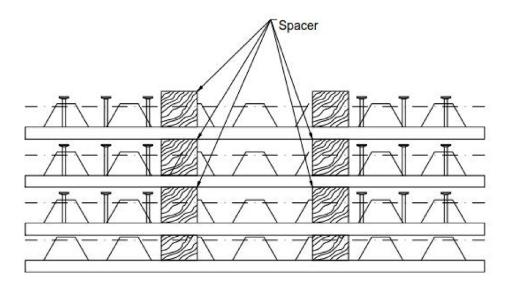

### Specification of intended use

- When installed correctly, the reinforcement elements have sufficient robustness to withstand usual actions before concreting.
- In case the studs are intended for use in prefabricated slabs there are no requirements in terms of before mentioned robustness if there are other possibilities to ensure a safe transport and positioning.

### Packaging, transportation and storage

 Special considerations shall be given to the transportation of the prefabricated elements to avoid any damage to the anchorage of the headed studs in the precast concrete slab
