Specific Part

1 Technical description of the product

SP-HBS, SP-Drill, SP-Super-Drill, T-Drill and TBS-Drill screws are self-tapping screws made from special stainless steel. Screws made from stainless steel no. 1.4006 are hardened. They have an antifriction coating. The outer thread diameter is not less than 3.0 mm and not greater than 10.0 mm. The overall length of the screws is ranging from 12 mm to 400 mm. Further dimensions are shown in Annex 4. The washers are made from stainless steel. The dimensions of the washers are given in Annex 4.

2 Specification of the intended use in accordance with the applicable European Assessment Document

The performances given in Section 3 are only valid if the screws are used in compliance with the specifications and conditions given in Annex 1 to 3.

Durability is only ensured if the specifications of intended use according to Annex 1 to 3 are taken into account.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the screws of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Dimensions	See Annex 4
Characteristic yield moment	See Annex 2
Bending angle	See Annex 2
Characteristic withdrawal parameter	See Annex 2
Characteristic head pull-through parameter	See Annex 2
Characteristic tensile strength	See Annex 2
Characteristic yield strength	No performance determined
Characteristic torsional strength	See Annex 2
Insertion moment	See Annex 2
Spacing, end and edge distances of the screws and minimum thickness of the wood based material	See Annex 2
Slip modulus for mainly axially loaded screws	See Annex 2
Durability against corrosion	See Annex 2

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1

3.3 Safety and accessibility in use (BWR 4)

Same as BWR 1

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with EAD No. 130118-01-0603 the applicable European legal act is: 97/176/EC. The system to be applied is: 3

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable EAD

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

Issued in Berlin on 10 January 2020 by Deutsches Institut für Bautechnik

BD Dipl.-Ing. Andreas Kummerow beglaubigt:
Head of Department Dewitt

Annex 1 Specifications of intended use

A.1.1 Use of the S+P screws only for:

Static and quasi-static loads

A.1.2 Base materials

The screws are used for connections in load bearing timber structures between timber members or between those members and steel members:

- Solid timber (softwood) according to EN 14081-1¹,
- Glued laminated timber (softwood) according to EN 14080²,
- Laminated veneer lumber LVL (softwood) according to EN 14374³, arrangement of the screws only perpendicular to the plane of the veneers,
- Glued solid timber (softwood) according to EN 14080 or national provisions that apply at the installation site.
- Cross-laminated timber (softwood) according to European Technical Approvals/Assessments or national provisions that apply at the installation site.

The screws can be used for connecting the following wood-based panels to the timber members mentioned above:

Plywood according to EN 636⁴ and EN 13986⁵,

EN 14081-1:2005+A1:2011

- Oriented Strand Board, OSB according to EN 300⁶ and EN 13986,
- Particleboard according to EN 312⁷ and EN 13986,
- Fibreboards according to EN 622-2⁸, EN 622-3⁹ and EN 13986,
- Cement-bonded particle boards according to EN 634-2¹⁰ and EN 13986,
- Solid-wood panels according to EN 13353¹¹ and EN 13986.

Wood-based panels are only arranged on the side of the screw head.

SP-HBS and SP-Drill screws with an outer thread diameter of at least 6 mm are also used for the fixing of thermal insulation material on top of rafters.

A.1.3 Use Conditions (environmental conditions)

The corrosion protection of the S+P screws is specified in Annex A.2.6.

A.1.4 Installation provisions

EN 1995-1-1¹² in conjunction with the respective national annex applies for the installation.

The screws are either driven into the timber member made of softwood without pre-drilling or in pre-drilled holes with a diameter not exceeding the inner thread diameter.

The screw holes in steel members are pre-drilled with an adequate diameter greater than the outer thread diameter.

A minimum of two screws is used for connections in load bearing timber structures.

If screws with an outer thread diameter d≥8 mm are used in load-bearing timber structures, the structural solid or glued laminated timber, laminated veneer lumber and similar glued members is from spruce, pine or fir.

In the case of fastening battens on thermal insulation material on top of rafters the screws are driven in the rafter through the battens and the thermal insulation material without pre-drilling in one seguence.

Countersunk head screws can be used with washers according to Annex 4. After inserting the screw the washers touch the surface of the timber member completely. Screws made from stainless steel are used with washers made from stainless steel.

By fastening screws in timber members the head of the screws is flush with the surface of the timber member. For screws with a pan washer or hexagon head the head part remains unconsidered.

EN 1995-1-1:2004+A1:2008+A2:2014

A.2.1 General

All S+P screws achieve a bending angle α of at least 45/d^{0.7} + 20, where d is the outer thread diameter of the screws.

The minimum penetration length of the threaded part of the screw lef shall be

$$I_{ef} = \frac{4 \cdot d}{\sin \alpha}$$

where

 α angle between screw axis and grain direction

d outer thread diameter of the screw.

The outer thread diameter of screws inserted in cross-laminated timber is at least 6 mm.

To connect cross-laminated timber the inner thread diameter d_1 of the screws is greater than the maximal width of the gaps in the layer.

S+P screws	
Characteristic values of the load-carrying capacities	Annex 2.1

A.2.2 Laterally loaded screws

The outer thread diameter d is used as effective diameter of the screw according to EN 1995-1-1.

A.2.3 Axially loaded screws

The axial slip modulus K_{ser} of the threaded part of a screw for the serviceability limit state per side shall be taken independent of angle α to the grain as:

$$K_{\text{ser}} = 780 \cdot d^{0.2} \cdot l_{\text{of}}^{0.4} \quad [\text{N/mm}]$$
 (2.1)

where

d outer thread diameter of the screw [mm]

lef penetration length of the of the threaded part of the screw in the timber member [mm].

A.2.3.1 Axial withdrawal capacity

The characteristic withdrawal parameter at an angle of $\alpha = 90^{\circ}$ to the grain based on a characteristic density of the wood-based member of 350 kg/m³ is

 $f_{ax,90,k}$ = 13.7 N/mm² for SP-HBS and SP-Super-Drill screws

 $f_{ax,90,k}$ = 10.0 N/mm² for SP-Drill, SP-HBS hardened, T-Drill and TBS-Drill screws.

For LVL a maximum characteristic density of 500 kg/m³ shall be used in equation (8.40a) of EN 1995-1-1.

For screws penetrating more than one layer of cross-laminated timber the different layers may be taken into account proportionally. In the lateral surfaces of the cross-laminated timber the screws shall be fully inserted in one layer.

A.2.3.2 Head pull-through capacity

The characteristic value of the head pull-through parameter for SP-screws for a characteristic density of 350 kg/m³ of the timber and for wood-based panels like

- Plywood according to EN 636 and EN 13986
- Oriented Strand Board, OSB according to EN 300 and EN 13986
- Particleboard according to EN 312 and EN 13986
- Fibreboards according to EN 622-2, EN 622-3 and EN 13986
- Cement-bonded particle board according to EN 634-2 and EN 13986
- Solid wood panel according to EN 13353 and EN 13986

with a thickness of more than 20 mm is

 $f_{head,k} = 9.4 \text{ N/mm}^2$.

For wood-based panels a maximum characteristic density of 380 kg/m³ shall be used in equation (8.40b) of EN 1995-1-1.

For wood based panels with a thickness 12 mm \leq t \leq 20 mm the characteristic value of the head pull-through parameter for S+P screws is:

 $f_{head,k} = 8 \text{ N/mm}^2$

Electronic copy of the ETA by DIBt: ETA-11/0283

For wood based panels with a thickness of less than 12 mm the characteristic head pull-through capacity for SP-screws shall be based on a characteristic value of the head pull-through parameter of 8 N/mm², and limited to 400 N complying with the minimum thickness of the wood based panels of 1,2·d, with d as outer thread diameter and the values in Table A.2.2.

S+P screws

Characteristic values of the load-carrying capacities

Annex 2.2

Page 9 of European Technical Assessment ETA-11/0283 of 10 January 2020

English translation prepared by DIBt

Table A.2.2 Minimum thickness of wood based panels

Wood based panel	Minimum thickness [mm]
Plywood	6
Fibreboards (hardboards and medium boards)	6
Oriented Strand Boards, OSB	8
Particleboards	8
Cement-bonded particle board	8
Solid wood Panels	12

In steel-to-timber connections the head pull-through capacity is not decisive.

A.2.4 Spacing, end and edge distances of the screws and minimum thickness of the wood based material

A.2.4.1 Laterally and/or axially loaded screws

Screws in pre-drilled holes

For SP-screws in pre-drilled holes the minimum spacings, end and edge distances are given in EN 1995-1-1, clause 8.3.1.2 and Table 8.2 as for nails in pre-drilled holes. Here, the outer thread diameter d shall be considered.

Minimum thickness for structural timber members made from solid timber, glued laminated timber, glued solid timber, laminated veneer lumber and cross laminated timber is t = 30 mm for screws with $d \le 8$ mm and t = 40 mm for screws with d = 10 mm.

Screws in non pre-drilled holes

For SP-screws minimum spacing and distances are given in EN 1995-1-1, clause 8.3.1.2 and Table 8.2 as for nails in non-predrilled holes. Here, the outer thread diameter d shall be considered.

For Douglas fir members minimum spacing and distances parallel to the grain are increased by 50%.

Minimum distances from loaded or unloaded ends are at least 15·d for screws with outer thread diameter $d \ge 8$ mm and timber thickness $t < 5 \cdot d$.

Minimum distances from the unloaded edge perpendicular to the grain may be reduced to $3 \cdot d$ also for timber thickness $t < 5 \cdot d$, if the spacing parallel to the grain and the end distance is at least $25 \cdot d$.

A.2.4.2 Only axially loaded screws

For SP-screws the minimum spacings, end and edge distances are given in EN 1995-1-1, clause 8.3.1.2 and Table 8.2 as for nails in non-predrilled holes and clause 8.7.2, Table 8.6.

A.2.5 Insertion moment

The ratio between the characteristic torsional strength $f_{tor,k}$ and the mean value of insertion moment $R_{tor,mean}$ fulfills the requirement for all screws.

A.2.6 Durability against corrosion

Steel no. 1.4006, 1.4301, 1.4567, 1.4401, 1.4571, 1.4539 and 1.4529 is used for screws made from stainless steel.

Washers are made from steel no. 1.4301.

Contact corrosion shall be avoided.

S+P screws	
Spacing, end and edge distances and durability against corrosion	Annex 2.3

Annex 3 - Fastening of thermal insulation material on top of rafters (informative)

A.3.1 General

SP-HBS and SP-Drill screws with an outer thread diameter of at least 6 mm are also used for the fixing of thermal insulation material on top of rafters.

The thickness of the thermal insulation material is up to 300 mm. A thermal insulation material is used that is applicable as insulation on top of rafters.

The battens are from solid timber (softwood) according to EN 14081-1. The minimum thickness t and the minimum width b of the battens are given as follows:

Table A.3.1 Minimum thickness and minimum width of the battens

Outer thread diameter [mm]	Minimum thickness t [mm]	Minimum width b [mm]
6 and 8	30	50
10	40	60

Instead of battens the following wood-based panels may be used to cover the thermal insulation material if they are suitable for that use:

- Plywood according to EN 636 and EN 13986,
- Oriented Strand Board, OSB according to EN 300 and EN 13986,
- Particleboard according to EN 312 and EN 13986
- Fibreboards according to EN 622-2, EN 622-3 and EN 13986.

The minimum thickness of the wood-based panels is 22 mm.

The word batten includes the meaning of wood-based panels in the following.

The spacing between screws e is not more than 1.75 m.

Friction forces are not considered for the design of the characteristic axial load of the screws.

The anchorage of wind suction forces as well as the bending stresses of the battens, respectively, are considered for design. Screws perpendicular to the grain of the rafter (angle α = 90 °) may be arranged if necessary.

A.3.2 Parallel inclined screws and thermal insulation material in compression

A.3.2.1 Mechanical model

The system of rafter, thermal insulation material on top of rafter and battens parallel to the rafter is considered as a beam on elastic foundation. The batten represents the beam, and the thermal insulation material on top of the rafter the elastic foundation. The minimum compression stress of the thermal insulation material at 10 % deformation, measured according to EN 826¹³, shall be $\sigma_{(10~\%)}$ = 0,05 N/mm². The batten is loaded perpendicular to the axis by point loads F_b . Further point loads F_s are from the shear load of the roof due to dead and snow load, which are transferred from the screw heads into the battens.

Figure A.3.3 Point loads F_s perpendicular to the battens, load application in the area of the screw heads

S+P screws	
Fastening of the thermal insulation material on top of rafters	Annex 3.3

A.3.2.2 Design of the battens

It's assumed that the spacing between the counter battens exceeds the characteristic length I_{char}.

The characteristic values of the bending stresses are calculated as:

$$M_{k} = \frac{(F_{b,k} + F_{s,k}) \cdot I_{char}}{4}$$
(3.1)

$$I_{char}$$
 = characteristic length $I_{char} = \sqrt[4]{\frac{4 \cdot EI}{W_{ef} \cdot K}}$ (3.2)

= bending stiffness of the batten

= coefficient of subgrade

 w_{ef} = effective width of the thermal insulation material

 $F_{b,k}$ = characteristic value of the point loads perpendicular to the battens

 $F_{s,k}$ = characteristic value of the point loads perpendicular to the battens, load application in the area of the screw heads

The coefficient of subgrade K may be calculated from the modulus of elasticity E_{HI} and the thickness t_{HI} of the thermal insulation material if the effective width wef of the thermal insulation material under compression is known. Due to the load extension in the thermal insulation material the effective width wef is greater than the width of the batten or rafter, respectively. For further calculations, the effective width wef of the thermal insulation material may be determined according to:

$$W_{ef} = W + t_{HI}/2 \tag{3.3}$$

= minimum from width of the batten or rafter, respectively

t_{HI} = thickness of the thermal insulation material

$$K = \frac{E_{HI}}{t_{HI}}$$
 (3.4)

The following condition shall be satisfied:

$$\frac{\sigma_{m,d}}{f_{m,d}} = \frac{M_d}{W \cdot f_{m,d}} \le 1 \tag{3.5}$$

For the calculation of the section modulus W the net cross section shall be considered.

The characteristic value of the shear stresses shall be calculated according to:

$$V_{k} = \frac{\left(F_{b,k} + F_{S,k}\right)}{2} \tag{3.6}$$

The following condition need to be satisfied:

$$\frac{\tau_{d}}{f_{v,d}} = \frac{1.5 \cdot V_{d}}{A \cdot f_{v,d}} \le 1 \tag{3.7}$$

For the calculation of the cross section area the net cross section shall be considered.

S+P screws	
Fastening of the thermal insulation material on top of rafters	Annex 3.4

A.3.2.3 Design of the thermal insulation material

The characteristic value of the compressive stresses in the thermal insulation material shall be calculated according to:

$$\sigma_{k} = \frac{1.5 \cdot F_{b,k} + F_{s,k}}{2 \cdot I_{char} \cdot W}$$
(3.8)

The design value of the compressive stress shall not be greater than 110 % of the compressive stress at 10 % deformation calculated according to EN 826.

A.3.2.4 Design of the screws

The screws are loaded predominantly axial. The characteristic value of the axial tension force in the screw may be calculated from the shear loads of the roof R_s :

$$T_{S,k} = \frac{R_{S,k}}{\cos \alpha} \tag{3.9}$$

The load-carrying capacity of axially loaded screws is the minimum design value of the axial withdrawal capacity of the threaded part of the screw, the head pull-through capacity of the screw and the tensile capacity of the screw according to Annex 2.

In order to limit the deformation of the screw head for thermal insulation material with thickness over 200 mm or with compressive strength below 0.12 N/mm^2 , respectively, the axial withdrawal capacity of the screws are reduced by the factors k_1 and k_2 :

$$F_{ax,\alpha,Rd} = min \left\{ \frac{f_{ax,d} \cdot d \cdot l_{ef} \cdot k_1 \cdot k_2}{1.2 \cdot \cos^2 \alpha + \sin^2 \alpha} \cdot \left(\frac{\rho_k}{350}\right)^{0.8}; f_{head,d} \cdot d_h^2 \cdot \left(\frac{\rho_k}{350}\right)^{0.8}; \frac{f_{tens,k}}{\gamma_{M2}} \right\}$$
(3.10)

where:

f_{ax,d} design value of the axial withdrawal parameter of the threaded part of the screw [N/mm²]

d outer thread diameter of the screw according to Annex 4 [mm]

 l_{ef} penetration length of the threaded part of the screw in the batten, $l_{ef} \ge 40$ mm characteristic density of the timber member [kg/m³], for LVL $\rho_k \le 500$ kg/m³

 α angle α between screw axis and grain direction, $30^{\circ} \le \alpha \le 90^{\circ}$

 $f_{\text{head,d}}$ design value of the head pull-through parameter of the screw [N/mm²]

d_h head diameter of the screw [mm]

f_{tens,k} characteristic tensile capacity of the screw according to Annex 2 [N]

 γ_{M2} partial factor according to EN 1993-1-1 in conjunction with the particular national annex

 k_1 min {1; 220/ t_{HI} } k_2 min {1; $\sigma_{10\%}/0.12$ }

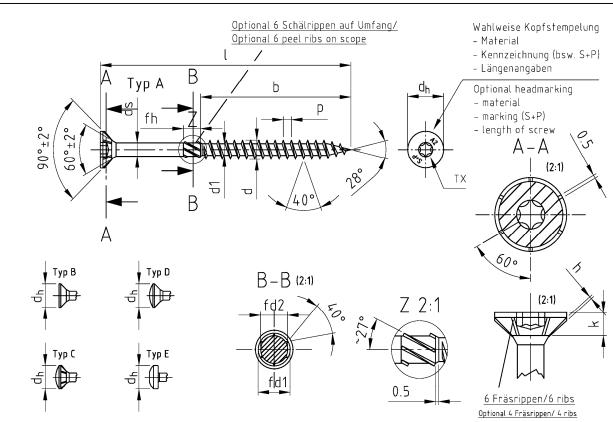

thickness of the thermal insulation material [mm]

σ_{10%} compressive stress of the thermal insulation material under 10 % deformation [N/mm²]

If equation (3.10) is fulfilled, the deflection of the battens does not need to be considered when designing the load-carrying capacity of the screws.

S+P screws
