The European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction shall be identified as such.

This European Technical Assessment may be withdrawn by the issuing Technical Assessment Body, in particular pursuant to information by the Commission in accordance with Article 25(3) of Regulation (EU) No 305/2011.

Specific Part

1 Technical description of the product

The ANCOPLUS double headed studs with ribbed shafts are made of weldable ribbed reinforcement bars with nominal characteristic yield strength of 500 MPa. The mechanical properties of the steel used meet the requirement according to EN 1992-1-1:2004 + AC:2010, section 4.4.

They have a head at both ends with a diameter of three times the shaft diameter.

The diameters of the shafts are 10, 12, 14, 16, 20 and 25 mm.

The studs are assembled to form reinforcement elements comprising at least two studs. All studs of one of those reinforcement element shall have the same diameter.

The following variants of assembling the reinforced elements are considered:

a) Double headed studs with steel bars welded to the head:

The studs are tack welded at one head to non-structural steel bars $d_s = 6$ mm to 10 mm for securing the position of the double headed studs when pouring the concrete.

b) Double headed studs with steel bars welded to the shaft.

The studs are spot-welded at the shaft to non-structural steel bars with a diameter $d_s = 6$ mm (studs with a diameter $d_A < 20$ mm) and $d_s = 8$ mm (studs with $d_A \geq 20$ mm). The distance between the anchor head in the compression zone and the welded reinforcement bars shall not exceed 80 mm.

The material for the steel bars shall be reinforcing steel (according to EN 1992-1-1:2004 + AC:2010, section 4.4) or smooth steel bars (structural steel) with material No. 1.0037, 10038 or 1.0045 according to EN 10025-2:2019 or non-corrosive steel No. 1.4401, 1.4404, 1.4439, 1.4571 according to EN 10088-5:2009.

The detailed product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European Assessment Document

The performances given in Section 3 are only valid if the Product is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the Product of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Increasing factor for punching shear resistance	$k_{pu,sl} = 1,96$ $k_{pu,fo} = 1,50$
characteristic fatigue strength for $N = 2 \cdot 10^6$ load cycles	$\Delta\sigma_{Rsk,n=2 \cdot 10^6} = 70 \text{ MPa}$

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	class A1

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with EAD No. 160003-00-0301 the applicable European legal act is: [97/597/EC(EU)].

The system(s) to be applied is (are): [1+]

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable EAD

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

Specification of the intended use

Double head anchors are used to increase the punch shear load carrying capacity of flat ceilings or foundation and base plates under static, quasi-static and loads susceptible to fatigue. Double head anchors are arranged next to the supports or concentrated single loads. The dimensioning of the punch shear load carrying capacity of flat ceilings or foundation and base plates is carried out according to EOTA TR 060. The intended use includes the following specifications:

- Flat ceilings or foundation and base plates made from reinforced normal concrete of strength class C20/25 to C50/60 according to EN 206-1:2000
- Flat ceilings or foundation and base plates with a minimum height of $h=180$ mm
- Double head anchor as reinforcement elements of the same diameter and type in punching shear area around the supports or concentrated single load
- Double head anchor as reinforcement elements, that are arranged in a vertical or suspended position (mounting iron on the head or shaft)
- Double head anchor as reinforcement elements that are positioned such that the double head pins are located vertically to the flat ceiling or foundation and baseplates
- Double head anchor as reinforcement elements that are arranged radially to the support or highly concentrated loads and are distributed equally in the critical punching shear area
- Double head anchor as reinforcement elements that are positioned such that the top heads of the pins reach at least to the outer side of the uppermost layer of the bending reinforcement
- Double head anchor as reinforcement elements that are positioned such that the bottom heads of the pins reach at least to the outer side of the lowest layer of the bending reinforcement
- Double head anchor as reinforcement elements that are positioned such that the concrete cover complies with the provisions according to EN 1992-1-1
- Double head anchor as reinforcement elements that are arranged such that the minimum and maximum distances between the double head pins on an element and between the elements around a support or an area with concentrated load correspond with the provisions according to Annex B3 to B7
- Deviations of the position and the distances between each other in the floor plan of the plates compared with the planning documents that is more than one tenth of the plate thickness are not permissible

ancoPLUS® punching shear reinforcement

Intended use
Specification

Annex B1

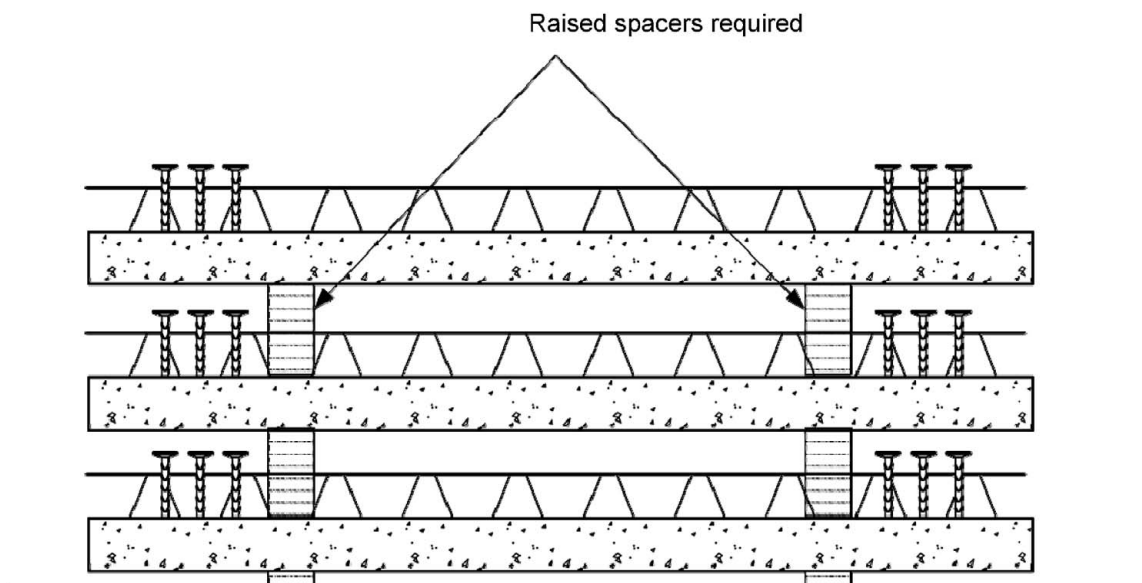

Installation:

When installed correctly, the anchors installed in the plate secure the position sufficiently and are resistant against the usual loading before concreting the plate.

When installing the double head anchor in the individual plates, no requirements are placed on the securing of the position and resistance previously mentioned if a reliable transport and the positioning of the anchor in the element plates has been ensured.

Packaging, transport and storage:

With the storage and transport of slab elements, the ancoPLUS® reinforcements must be observed that protrude beyond the lattice girders due to their height. The spacers necessary for the support of the slab elements must be raised accordingly.

Annex B7

Determination of critical perimeters u_1 and u_{out} for calculation of theoretical shear stresses

1. Critical perimeter u_1 :

a) Loaded area (column) located more than 6 d from openings or not close to free slab edges:

$$u_1 = \pi \times (c + 4 d)$$

$$u_1 = 2 \times (c_x + c_y) + 4 d_m \times \pi$$

a) Loaded area (column) located less than 6 d from slab openings (recesses):

c) Loaded area (column) located close to free edges:

2. Outer perimeter u_{out}

a) Loaded area (column) located more than $6d$ from slab openings (recesses) or not close to free slab edges:

Round column

$$u_{out} = \pi \times (2 l_s + c + 3 d)$$

Rectangular column

$$u_{out} = 2 (c_x + c_y) + \pi (2 l_s + 3 d)$$
