Specific Part

1 Technical description of the product

The "fischer injection system FIS EM Plus" is a bonded fastener consisting of a cartridge with injection mortar fischer FIS EM Plus and a steel element according to Annex A5.

The steel element is placed into a drilled hole filled with injection mortar and is anchored via the bond between metal part, injection mortar and concrete.

The product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European Assessment Document

The performances given in Section 3 are only valid if the anchor is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the anchor of at least 50 or 100 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance			
Characteristic resistance to tension load (static and quasi-static loading)	See Annex B 3 to B 8, C 1 to C 12			
Characteristic resistance to shear load (static and quasi-static loading)	See Annex C 1 to C 4			
Displacements under short-term and long-term loading	See Annex C 13 and C 14			
Characteristic resistance and displacements for seismic performance categories C1 and C2	See Annex C 15 to C 18			

3.2 Hygiene, health and the environment (BWR 3)

Essential characteristic	Performance
Content, emission and/or release of dangerous substances	No performance assessed

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with the European Assessment Document EAD 330499-01-0601 the applicable European legal act is: [96/582/EC].

The system to be applied is: 1

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable European Assessment Document

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited at Deutsches Institut für Bautechnik.

Issued in Berlin on 17 June 2020 by Deutsches Institut für Bautechnik

Specifications of intended use (part 2)

Base materials:

 Compacted reinforced or unreinforced normal weight concrete without fibres of strength classes C20/25 to C50/60 according to EN 206:2013+A1:2016

Use conditions (Environmental conditions):

- Structures subject to dry internal conditions (zinc coated steel, stainless steel or high corrosion resistant steel).
- For all other conditions according to EN1993-1-4:2015 corresponding to corrosion resistance classes to Annex A 6 table A6.1.

Design:

- · Anchorages have to be designed by a responsible engineer with experience of concrete anchor design.
- Verifiable calculation notes and drawings are to be prepared taking account of the loads to be anchored.
 The position of the anchor is indicated on the design drawings (e. g. position of the anchor relative to reinforcement or to supports, etc.).
- Anchorages are designed in accordance with: EN 1992-4:2018 and EOTA Technical Report TR 055, Edition February 2018

Installation:

- Anchor installation is to be carried out by appropriately qualified personnel and under the supervision of the person responsible for technical matters of the site
- In case of aborted hole: The hole shall be filled with mortar
- Anchorage depth should be marked and adhered to on installation
- · Overhead installation is allowed

Splitting failure for minimum edge distance and spacing in dependence of the effective embedment depth h_{ef} .

For the calculation of minimum spacing and minimum edge distance of anchors in combination with different embedment depths and thicknesses of concrete members the following equation shall be fulfilled:

 $A_{sp,req} < A_{sp,t}$

A_{sp,req} = required projecting area

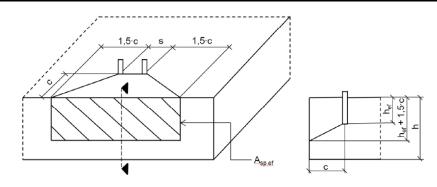

Electronic copy of the ETA by DIBt: ETA-17/0979

 $A_{sp,t} = A_{sp,ef} = effective projecting area (according to Annex B5)$

fischer injection system FIS EM Plus

fischer injection system FIS EM Plus

Intended use
Cleaning brush (steel brush)
Processing time and curing time

Annex B 9

²⁾ Minimal cartridge temperature +5°C

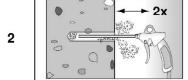

Installation instructions part 1

Drilling and cleaning the hole (hammer drilling with standard drill bit)

Drill the hole.

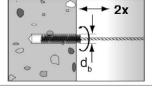

Nominal drill hole diameter **d**₀ and drill hole depth **h**₀ see **tables B3.1**, **B6.1**, **B7.1**, **B8.1**

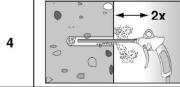

Cleaning the drill hole: Blow out the drill hole twice, with oil free compressed air ($p \ge 6$ bar)

3

Brush the drill hole twice. For drill hole diameter ≥ 30 mm use a power drill. For deep holes use an extension. Corresponding brushes see **table B9.1**

Cleaning the drill hole: Blow out the drill hole twice, with oil free compressed air (p ≥ 6 bar)

Go to step 6

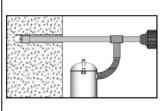

Drilling and cleaning the hole (hammer drilling with hollow drill bit)

1

Check a suitable hollow drill (see **table B1.1**) for correct operation of the dust extraction

2

Use a suitable dust extraction system, e. g. fischer FVC 35 M or a comparable dust extraction system with equivalent performance data

Drill the hole with hollow drill bit. The dust extraction system has to extract the drill dust nonstop during the drilling process and must be adjusted to maximum power. Nominal drill hole diameter d_0 and drill hole depth h_0 see tables B3.1, B6.1, B7.1, B8.1

Go to step 6

fischer injection system FIS EM Plus

Intended use

Installation instructions part 1

Annex B 10

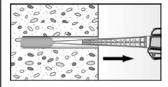

Installation instructions part 2 Drilling and cleaning the hole (wet drilling with diamond drill bit) Drill the hole. Drill hole diameter do and Break the drill core nominal drill hole depth ho 1 and remove it see tables B3.1, B6.1, 0 B7.1, B8.1 2 Flush the drill hole with clean water until it flows clear 3 Blow out the drill hole twice, using oil-free compressed air (p > 6 bar) Brush the drill hole twice using a power drill. 4 Corresponding brushes see table B9.1 5 Blow out the drill hole twice, using oil-free compressed air (p > 6 bar) Preparing the cartridge Remove the sealing cap 6 Screw on the static mixer (the spiral in the static mixer must be clearly visible) 7 Place the cartridge into the dispenser Extrude approximately 10 cm of material out until the resin is evenly grey in colour. Do not use 8 mortar that is not uniformly grey fischer injection system FIS EM Plus Annex B 11 Intended use Installation instructions part 2

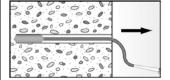

Installation instructions part 3

Injection of the mortar

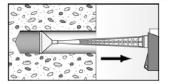

Fill approximately 2/3 of the drill hole with mortar. Always begin from the bottom of the hole and avoid bubbles

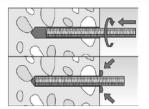

For drill hole depth ≥ 150 mm use an extension tube

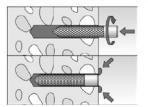

For overhead installation, deep holes ($h_0 > 250$ mm) or drill hole diameter ($d_0 \ge 40$ mm) use an injection-adapter

Installation of anchor rods or fischer internal threaded anchors RG MI

10

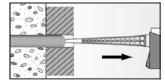

Only use clean and oil-free metal parts. Mark the setting depth of the metal parts. Push the anchor rod or fischer internal threaded RG MI anchor down to the bottom of the hole, turning it slightly while doing so.

After inserting the metal part, excess mortar must be emerged around the anchor element.

For overhead installations support the metal part with wedges (e. g. fischer centering wedges) or fischer overhead clips.

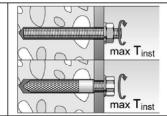

For push through installation fill the annular gap with mortar

11

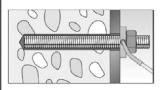

Wait for the specified curing time t_{cure} see table B9.2

12

Mounting the fixture max T_{inst} see tables B3.1 and B6.1

Option

After the minimum curing time is reached, the gap between metal part and fixture (annular clearance) may be filled with mortar via the fischer filling disc. Compressive strength ≥ 50 N/mm² (e.g. fischer injection mortars FIS HB, FIS SB, FIS V, FIS EM Plus)

ATTENTION: Using fischer filling disc reduces t_{fix} (usable length of the anchor)

fischer injection system FIS EM Plus

Intended use

Installation instructions part 3

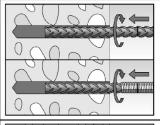

Annex B 12

Z51956.20

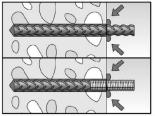

Installation instructions part 4

Installation reinforcing bars and fischer rebar anchor FRA

Only use clean and oil-free reinforcing bars or fischer FRA. Mark the setting depth. Turn while using force to push the reinforcement bar or the fischer FRA into the filled hole up to the setting depth mark

10

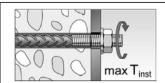

When the setting depth mark is reached, excess mortar must be emerged from the mouth of the drill hole.

11

Wait for the specified curing time t_{cure} see **table B9.2**

12

Mounting the fixture max T_{inst} see **table B8.1**

Electronic copy of the ETA by DIBt: ETA-17/0979

Performances

Characteristic values for steel failure under tension / shear load for fischer anchor rods and standard threaded rods under seismic action (performance category C1 / C2)

Annex C 15

²⁾ Values in brackets are valid for undersized threaded rods with smaller stress area A_s for hot dip galvanised standard threaded rods according to EN ISO 10684:2004+AC:2009.

³⁾ Values in brackets are valid for filled annular gaps between the anchor rod and the through-hole in the attachment. It is necessary to use the fischer filling disc according to Annex A 1

⁴⁾ No performance assessed
