The European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction shall be identified as such.

This European Technical Assessment may be withdrawn by the issuing Technical Assessment Body, in particular pursuant to information by the Commission in accordance with Article 25(3) of Regulation (EU) No 305/2011.

Specific Part

1 Technical description of the product

The subject of this European Technical Assessment is the post-installed connection, by anchoring or overlap connection joint, of reinforcing bars (rebars) in existing structures made of normal weight concrete, using the B+BTec Injection System BIS-PE GEN3 in accordance with the regulations for reinforced concrete construction.

Reinforcing bars with a diameter ϕ from 8 to 40 mm according to Annex A and the injection mortar BIS-PE GEN3 are used for the post-installed rebar connection. The rebar is placed into a drilled hole filled with injection mortar and is anchored via the bond between embedded reinforcing bar, injection mortar and concrete.

The product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European assessment Document

The performances given in Section 3 are only valid if the rebar connection is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the rebar connections of at least 50 and/or 100 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance						
Characteristic resistance to tension load (stati	tic and quasi-static loading)						
Resistance to combined pull-out and concrete failure in uncracked concrete	See Annex C 2 to C 3						
Resistance to concrete cone failure	See Annex C 1						
Robustness	See Annex C 2 to C 3						
Resistance to bond-splitting failure	See Annex C 2 to C 3						
Influence of cracked concrete on resistance to combined pull-out and concrete failure	See Annex C 2 to C 3						
Characteristic resistance to tension load (seismic loading)	No performance assessed						

European Technical Assessment ETA-23/0698

Page 4 of 19 | 1 November 2023

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with European Assessment Document EAD No. 332402-00-0601, the applicable European legal act is: [96/582/EC].

The system to be applied is: 1

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable European Assessment Document

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

Issued in Berlin on 1 November 2023 by Deutsches Institut für Bautechnik

Dipl.-Ing. Beatrix Wittstock Head of Section *beglaubigt:* Baderschneider

Installation instructions

Attention: Before drilling, remove carbonated concrete and clean contact areas (see Annex B 1) In case of aborted drill hole: the drill hole shall be filled with mortar.

Drilling of the bore hole

Ia. Hammer drilling (HD) / Compressed air drilling (CD)

Drill a hole to the required embedment length. Drill bit diameter according to Table B3. Proceed with Step 2 (MAC or CAC).

Hollow drill bit system (HDB) (see Annex B 4) Drill a hole to the required embedment length. Drill bit diameter according to Table B4. The hollow drilling system removes the dust and cleans the bore hole. Proceed with Step 3.

Diamond drilling (DD)

Drill a hole to the required embedment length required Drill bit diameter according to Table B3. Proceed with Step 2 (SPCAC).
