General Part

Technical Assessment Body issuing the
European Technical Assessment:

Deutsches Institut für Bautechnik

Trade name of the construction product

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Product family
to which the construction product belongs

Anchor channels

Manufacturer

PohlCon GmbH
Nobelstraße 51
12057 Berlin
DEUTSCHLAND

Manufacturing plant

Pohlcon manufacturiung plants

This European Technical Assessment
contains

75 pages including 3 annexes which form an integral part
of this assessment

This European Technical Assessment is
issued in accordance with Article 95(4) of
Regulation (EU) 2024/3110, on the basis of

EAD 330008-04-0601-v01

This version replaces

ETA-09/0338 issued on 18 June 2024

The European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction shall be identified as such.

This European Technical Assessment may be withdrawn by the issuing Technical Assessment Body, in particular pursuant to information by the Commission in accordance with Article 36(3) of Regulation (EU) No 2024/3110.

Specific Part

1 Technical description of the product

The JORDAHL anchor channel JTA, JZA, JXA and JXA-PC is a system consisting of C-shaped channel profile of carbon steel and stainless steel and at least two metal anchors non-detachably fixed to the channel back and channel bolts.

The anchor channel is embedded surface-flush in the concrete. Channel bolts JORDAHL T-bolts with appropriate hexagon nuts and washers are fixed to the channel.

The product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European Assessment Document

The performances given in Section 3 are only valid if the anchor channel is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the anchor channel of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance under static and quasi-static tension loading	
- Resistance to steel failure of anchors	$N_{Rk,s,a}$ see Annex C1 to C4
- Resistance to steel failure of the connection between anchors and channel	$N_{Rk,s,c}$ see Annex C1 to C4
- Resistance to steel failure of channel lips and subsequently pull-out of channel bolt	$N_{Rk,s,l}^0 ; s_{l,N}$ see Annex C1 to C4
- Resistance to steel failure of channel bolt	$N_{Rk,s}$ see Annex C7
- Resistance to steel failure by exceeding the bending strength of the channel	s_{max} see Annex A10 and A11 $M_{Rk,s,flex}$ see Annex C5 and C6
- Maximum installation torque to avoid damage during installation	$T_{inst,g} ; T_{inst,s}$ see Annex B5 and B6
- Resistance to pull-out failure of the anchor	$N_{Rk,p}$ see Annex C8 to C11
- Resistance to concrete cone failure	h_{ef} see Annex B3 and B4 $k_{cr,N} ; k_{ucr,N}$ see Annex C8 to C11
- Minimum edge distances, spacing and member thickness to avoid concrete splitting during installation	s_{min} see Annex A10 and A11 $c_{min} ; h_{min}$ see Annex B3 and B4
- Characteristic edge distance and spacing to avoid splitting of concrete under load	$s_{cr,sp} ; c_{cr,sp}$ see Annex C8 to C11
- Resistance to blowout failure - bearing area of anchor head	A_h see Annex A7 and A8

Essential characteristic	Performance
Characteristic resistance under static and quasi-static shear loading - Resistance to steel failure of channel bolt under shear loading without lever arm - Resistance to steel failure by bending of the channel bolt under shear load with lever arm - Resistance to steel failure of channel lips, steel failure of connection between anchor and channel and steel failure of anchor (shear load in transverse direction) - Resistance to steel failure of connection between channel lips and channel bolt (shear load in longitudinal channel axis) - Factor for sensitivity to installation (longitudinal shear) - Resistance to steel failure of the anchor (longitudinal shear) - Resistance to steel failure of connection between anchor and channel (longitudinal shear) - Resistance to concrete pry-out failure - Resistance to concrete edge failure	$V_{Rk,s}$ see Annex C19 and C20 $M_{Rk,s}^0$ see Annex C19 and C20 $V_{Rk,s,l,y}^0 ; S_{l,V} ; V_{Rk,s,c,y} ; V_{Rk,s,a,y}$ see Annex C13 to C16 $V_{Rk,s,l,x}$ see Annex C13, C15 and C16 γ_{inst} see Annex C13, C15 and C16 $V_{Rk,s,a,x}$ see Annex C13, C15 and C16 $V_{Rk,s,c,x}$ see Annex C13, C15 and C16 k_8 see Annex C17 and C18 $k_{cr,V} ; k_{ucr,V}$ see Annex C17 and C18
Characteristic resistance under combined static and quasi-static tension and shear loading - Resistance to steel failure of the anchor channel	$k_{13} ; k_{14}$ see Annex C22
Characteristic resistance under fatigue tension loading - Fatigue resistance to steel failure of the whole system (continuous or tri-linear function, assessment method A1, A2) - Fatigue limit resistance to steel failure of the whole system (assessment method B) - Fatigue resistance to steel failure of the whole system (linearized function, assessment method C) - Fatigue resistance to concrete related failure (exponential function, assessment method A1, A2) - Fatigue limit resistance to concrete related failure (assessment method B) - Fatigue resistance to concrete related failure (linearized function, assessment method C)	$\Delta N_{Rk,s,0,n}$ ($n = 1$ to $n = \infty$) see Annex C23 $\Delta N_{Rk,s,0,\infty}$ see Annex C23 $\Delta N_{Rk,s,lo,n} ; N_{lok,s,n}$ ($n = 10^4$ to $n = \infty$) see Annex C25 $\Delta N_{Rk,c,0,n} ; \Delta N_{Rk,p,0,n}$ ($n = 1$ to $n = \infty$) see Annex C23 $\Delta N_{Rk,c,0,\infty} ; \Delta N_{Rk,p,0,\infty}$ see Annex C23 $\Delta N_{Rk,c,E,n} ; \Delta N_{Rk,p,E,n}$ ($n = 10^4$ to $n = \infty$) see Annex C25

Essential characteristic	Performance
Characteristic resistance under fatigue shear loading - Fatigue resistance to steel failure of the whole system under shear load perpendicular to the longitudinal channel axis (bilinear function, assessment method C) - Fatigue resistance to steel failure of the whole system under shear load in the direction of the longitudinal channel axis (bilinear function, assessment method C) - Fatigue resistance to concrete pry-out failure perpendicular to the longitudinal channel axis and in the direction of the longitudinal (bilinear function, assessment method C)	$\Delta V_{Rk,s,y,lo,n} ; V_{lok,s,y,n}$ ($n = 10^4$ to $n = \infty$) see Annex C26 $\Delta V_{Rk,s,x,lo,n} ; V_{lok,s,x,n}$ ($n = 10^4$ to $n = \infty$) see Annex C26 $\Delta V_{Rk,cp,y,E,n} ; \Delta V_{Rk,cp,x,E,n}$ ($n = 10^4$ to $n = \infty$) see Annex C26
Characteristic resistance under combined fatigue tension and shear loading - Fatigue resistance to steel failure of the whole system	k_{sn} see Annex C27
Characteristic resistance under seismic loading (seismic performance category C1) - Resistance to steel failure under seismic tension loading (seismic performance category C1) - Resistance to steel failure under seismic shear loading for shear load in transverse direction (seismic performance category C1) - Resistance to steel failure under seismic shear loading for shear load in longitudinal channel axis (seismic performance category C1)	$N_{Rk,s,a.eq} ; N_{Rk,s,c.eq} ; N^0_{Rk,s,l.eq} ; N_{Rk,s.eq} ; M_{Rk,s,flex.eq}$ see Annex C29 to C34 $V_{Rk,s.eq} ; V^0_{Rk,s,l,y.eq} ; V_{Rk,s,c,y.eq} ; V_{Rk,s,a,y.eq}$ see Annex C35 to C39 $V_{Rk,s,l,x.eq} ; V_{Rk,s,a,x.eq} ; V_{Rk,s,c,x.eq}$ see Annex C35 to C37
Characteristic resistance under static and quasi-static tension and/or shear loading - Displacements	$\delta_{N0} ; \delta_{N\infty}$ see Annex C12 $\delta_{V,y,0} ; \delta_{V,y,\infty} ; \delta_{V,x,0} ; \delta_{V,x,\infty}$ see Annex C21 and C22

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1
Resistance to fire	See Annex C40 to C42

3.3 Other essential characteristics

Essential characteristic	Performance
Durability	See Annex B1

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with EAD No. 330008-04-0601-v01, the applicable European legal act is: [2000/273/EC].

The system to be applied is: 1

5 Technical details necessary for the implementation of the AVCP system, as provided for in the applicable EAD

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited with Deutsches Institut für Bautechnik.

The following standards are referred to in this European Technical Assessment:

EN 1992-1-1:2023	Eurocode 2: Design of concrete structures - Part 1-1: General rules - Rules for buildings, bridges and civil engineering structures
EN ISO 4042:2022	Fasteners - Electroplated coating systems (ISO 4042:2022)
EN ISO 10684:2004 + AC:2009	Fasteners - Hot dip galvanized coatings (ISO 10684:2004 + Cor. 1:2008)
EN ISO 1461:2022	Hot dip galvanized coatings on fabricated iron and steel articles - Specifications and test methods (ISO 1461:2022)
EN ISO 898-1:2013	Mechanical properties of fasteners made of carbon steel and alloy steel - Part 1: Bolts, screws and studs with specified property classes – Coarse thread and fine pitch thread (ISO 898-1:2013)
EN ISO 7089:2000	Plain washers – Normal series, Product grade A (ISO 7089:2000)
EN ISO 7093-1:2000	Plain washers - Large series - Part 1: Product grade A (ISO 7093-1:2000)
EN ISO 4032:2023	Fasteners – Hexagon regular nuts (style 1) (ISO 4032:2023)
EN ISO 3506-1:2020	Fasteners - Mechanical properties of corrosion-resistant stainless steel fasteners - Part 1: Bolts, screws and studs with specified grades and property classes (ISO 3506-1:2020)
EN 1993-1-4:2006 + A1:2015 + A2:2020	Eurocode 3: Design of steel structures - Part 1-4: General rules - Supplementary rules for stainless steels
EN ISO 898-2:2022	Fasteners - Mechanical properties of fasteners made of carbon steel and alloy steel – Part 2: Nuts with specified property classes (ISO 898-2:2022)

EN ISO 3506-2:2020	Fasteners - Mechanical properties of corrosion-resistant stainless steel fasteners - Part 2: Nuts with specified grades and property classes (ISO 3506-2:2020)
EN 10088-2:2024	Stainless steels - Part 3: Technical delivery conditions for sheet/plate and strip of corrosion resistant steels for general purposes
EN 206:2013 + A2:2021	Concrete - Specification, performance, production and conformity
EN 1992-4:2018	Eurocode 2 - Design of concrete structures - Part 4: Design of fastenings for use in concrete
EOTA TR047:2021-05	Design of anchor channels in addition to EN 1992-4
EOTA TR050:2023-10	Calculation method for the performance of Anchor channels under Fatigue Cyclic Loading
ETA-19/0483:2025-12-16	Injection system VME plus
ETA-20/1280:2024-8-20	Injection System EJOT MULTIFIX Epoxy/ Sormat ITH Epoxy for concrete
ETA-25/1078:2026-4-17	Injection System BOND-1000 for concrete

Annex A14

Specifications of intended use

Anchor channels and channel bolts subject to:

- Static and quasi-static tension und shear perpendicular to the longitudinal axis of the channel.
- Static and quasi-static shear in the direction of the longitudinal axis of the channel (anchor channels JTA with notching channel bolts JKB and JKC, anchor channels JZA with channel bolts JZS, anchor channels JXA with channel bolts JXD, JXH and JXE, as well as anchor channels JXA and JXA-PC with channel bolts JXB).
- Fatigue cyclic tension, fatigue cyclic shear perpendicular to the longitudinal axis of the channel, and fatigue cyclic shear in the direction of the longitudinal axis of the channel and combination thereof (anchor channels with channel bolts for assessment method A1, A2 and B according to Annex C23 and anchor channels with channel bolts for assessment method C according to Annex C24 and C27).
- Seismic tension and seismic shear perpendicular to the longitudinal axis of the channel and seismic shear in the direction of the longitudinal axis of the channel (seismic performance category C1) (anchor channels JTA with notching channel bolts JKB and JKC, anchor channels JZA with channel bolts JZS and anchor channels JXA with channel bolts JXD, JXH and JXE, as well as anchor channels JXA and JXA-PC with channel bolts JXB according to Annex C28).
- Fire exposure for concrete strength class C20/25 to C50/60 for tension and shear perpendicular to the longitudinal axis of the channel (anchor channels and channel bolts according to Annex C40 to C44).

Base materials:

- Reinforced or unreinforced compacted normal weight concrete without fibres according to EN 206.
- Concrete strength classes C12/15 to C90/105 according to EN 206.
- Cracked or uncracked concrete.

Service conditions (environmental conditions):

- Structures subject to dry internal conditions (anchor channels and channel bolts according to Annex A3 and A4, Table A1, column 1 – 5).
- Structures subject to internal conditions with usual humidity (e.g. kitchen, bath and laundry in residential buildings, except permanently damp conditions and applications under water) (anchor channels and channel bolts according to Annex A3 and A4, Table A1, column 2 – 5).
- According to EN 1993-1-4 relating to corrosion resistance class CRC III (anchor channels and channel bolts according to A4, Table A1, column 3 – 5).
- According to EN 1993-1-4 relating to corrosion resistance class CRC IV (anchor channels and channel bolts according to A4, Table A1, column 4 – 5).
- According to EN 1993-1-4 relating to corrosion resistance class CRC V (anchor channels and channel bolts according to A4, Table A1, column 5).

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Intended use
Specifications

Annex B1

Design:

- Anchor channels are designed under the responsibility on an engineer experienced in anchorages and concrete work.
- Verifiable calculation notes and drawings are prepared taking account of the loads to be anchored. The position of the anchor channel and channel bolts are indicated on the design drawings (e.g. position of the anchor channel relative to the reinforcement or to supports).
- For static, quasi-static and seismic (seismic performance category C1) loading as well as fire exposure the anchor channels are designed in accordance with EN 1992-4 and EOTA TR 047.
- For fatigue loading the anchor channels are designed in accordance with EOTA TR 050.
- The characteristic resistances are calculated with the minimum effective embedment depth.

Installation:

- The installation of anchor channels is carried out by appropriately qualified personnel under the supervision of the person responsible for the technical matters on site.
- Use of the anchor channels only as supplied by the manufacturer – without any manipulations, repositioning or exchanging of channel components.
- Cutting of anchor channels is allowed only if pieces according to Annex A10, Table A7 and Annex A11, Table A8 are generated including end spacing and minimum channel length and only to be used in dry internal conditions (Annex A3 and A4, Table A1, column 1). For anchor channels made of stainless steel there are no restrictions regarding corrosion resistance when using cut channel pieces, if cutting is done professionally and contamination of cutting edges with corroding material is avoided.
- Installation in accordance with the installation instructions given in Annexes B8 and B9.
- The anchor channels are fixed on the formwork, reinforcement or auxiliary construction such that no movement of the channels will occur during the time of laying the reinforcement and of placing and compacting the concrete.
- The annular gap between channel bolt shaft and hole in the fixture as well as the gap between channel bolt head and lips of the anchor channel is properly filled with injection mortar according to Annex B10 (for seismic and fatigue with shear loads).
- The concrete under the head of the anchors is properly compacted. The channels are protected from penetration of concrete into the internal space of the channel.
- Washer may be chosen according to Annex A3 and Annex A4 and provided separately by the user.
- Orientating the channel bolt (groove according to Annex A12 and Annex A13) perpendicular to the channel axis.
- The required installation torques given in Annex B5 and B6 must be applied and must not be exceeded.

¹⁾ Materials according to Annex A13 and A14

²⁾ According to Annex B7, Fig. 1

³⁾ According to Annex B7, Fig. 2

⁴⁾ T_{inst} must not be exceeded

⁵⁾ Product not available

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Intended use
Installation parameters of channel bolts (JZA, JXA and JXA-PC)

Annex B6

Fig. 1

General:

The fixture is in contact with the channel profile and the concrete surface. The installation torques according to Annex B5, Table B4 and Annex B6, Table B5 shall be applied and must not be exceeded.

Fig. 2

Steel-steel contact:

The fixture is not in contact with the concrete surface. The fixture is fastened to the anchor channel by suitable steel part (e.g. washer). The installation torques according to Annex B5, Table B4 and Annex B6, Table B5 shall be applied and must not be exceeded.

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Intended use
Position of the fixture

Annex B7

1. Fixing anchor channel

Install the channel surface flush and fix the channel undisplaceable to the formwork or to the reinforcement.

a) Fixing to steel formwork

With JORDAHL T-bolts and nuts, with rivets, cramps or with magnet fixings.

or

b) Fixing to timber formwork

With nails through the pre punched holes in the back of the channels and with staples.

or

c) Fixing of anchor channels at the top

- To timber batten on the side formwork (e.g. with JORDAHL T-bolts).
- Fixing from above directly to the reinforcement or to a mounting reinforcing bar, attach the channel by wire binding.

2. Pouring concrete and regular compacting of concrete

Compact the concrete properly around the channel and the anchors.

a) at side of member

or

b) at bottom of member

or

c) at top of member

3. Removing of the infill

Clean the channel on the outside after removing the formwork.

a) PS foam infill

With a hammer or a hook.

or

b) PE foam infill

By hand or with help of a screw driver in one piece.

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Intended use
Installation instruction anchor channels

Annex B8

4. Fastening the JORDAHL T-bolt to the JORDAHL anchor channel

Fig. 1

Fig. 2

Table 1

a) Installation torques (general)

1. Insert the JORDAHL T-bolt into the channel slot at any point along the channel length between the anchors (Fig. 1).
2. Turn the channel bolt 90° clockwise and the head of the channel bolt locks into position (Fig. 1).
3. Do not mount the channel bolt at the end of the channel within the end spacing x according to Annex A10 and A11.
4. Use the washer under the nut (Fig. 1).
5. Check the correct fit of the channel bolt.
The groove on the shank end of the channel bolt must be perpendicular to the channel longitudinal axis.
6. Tighten the nuts to the installation torque according to Table 1 (Fig. 2). The installation torque must not be exceeded.

OR

Fig. 3

b) Installation torques (steel-steel contact)

1. Use washers between the channel and the fixture to create a defined contact
2. Tighten the nuts to the installation torque according to Table 2. The installation torque must not be exceeded.

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Intended use
Installation instruction channel bolts

Annex B9

5. Installation of JORDAHL gap filler set JGF
For seismic load and fatigue shear.

- 1. Slide the matching injection insert (Annex A14, Fig. 1) on channel bolt to rest on the anchor channel.
- 2. Install fixture, washer, and injection nut (Annex A14, Fig. 2).
- 3. Insert static mixer PM – 19E with mixer reduction MR¹⁾ (applicator gun, static mixer, and mixer reduction by injection mortar system manufacturer).
- 4. Inject injection mortar²⁾ to fill the gap.

¹⁾ Outer diameter 4 mm
²⁾ Dispense the first part of the injection mortar to waste until an even colour is achieved
Injection system VME plus in accordance with ETA-19/0483, Injection system EJOT MULTIFIX Epoxy/Sormat ITH Epoxy in accordance with ETA-20/1280 and Injection system BOND-1000 for concrete in accordance with ETA-25/1078, note the appropriate working and curing time.

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Intended use
Installation instruction gap filler set

¹⁾ $V_{y,Elok}$ is the characteristic lower cyclic shear load on the anchor perpendicular to the longitudinal axis of the channel on the anchor and $V_{x,Elok}$ is the characteristic lower cyclic shear load in the direction of the longitudinal axis of the channel on the anchor

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Performance

Characteristic resistances under fatigue shear load according to assessment method C (JXA)

Annex C26

For Design method I or II for assessment method C according to EOTA TR050 (continued)

For steel failure under combined tension and shear loading the following exponent for verification of steel failure according to EOTA TR 050 [2], Table 3.6 are given:

$k_{sn} = 0,7$ for channel bolts with thread diameter M16 and larger

For Design method I and II for assessment method A1, A2, B or C according to EOTA TR050,

In absence of other national regulations the following partial factors are recommended for design method I and II for all failure modes:

$\gamma_{Ms,fat} = 1,35$ for steel
 $\gamma_{Mc,fat} = \gamma_{Mp,fat} = \gamma_{Mcp,fat} = 1,50$ for concrete

JORDAHL anchor channel JTA, JZA, JXA and JXA-PC

Performance
Characteristic resistances under fatigue interaction load
according to assessment method C (JXA), partial factors

Annex C27

For seismic performance category C1

Table C45: Combinations of anchor channels JTA W, JZA, JXA, and JXA-PC with channel bolts for seismic loading
